

WHAT IS CLAIMED IS:

1. A method for sharing encrypted data region among two or more processes on a tamper resistant processor having a program and data encryption/decryption function, the method comprising:

giving a common key to each one of the two or more processes in advance;

shifting an execution mode of the tamper resistant processor to an encrypted instruction execution mode;

operating an owner process among the two or more processes to generate a shared encrypted data region valid only with respect to the common key in a process space of the owner process;

operating each client process other than the owner process among the two or more processes to map the shared encrypted data region generated by the owner process to a process space of the each client process; and

setting address information of the shared encrypted data region for each process among the two or more processes in relation to the common key in an encrypted attribute register inside the tamper resistant processor.

2. The method of claim 1, further comprising:

encrypting/decrypting data to be sent/received to/from an external memory at the tamper resistant processor by referring to information set in the encrypted attribute register inside the tamper resistant processor when the each process carries out a write/read operation with respect to the shared encrypted data region.

3. A method for sharing encrypted data region among two processes on a tamper resistant processor having a program and data encryption/decryption function, the method comprising:

10028794-12301

(a) shifting an execution mode of the tamper resistant processor to an encrypted instruction execution mode;

(b) operating each process among the two processes to generate a hidden data region of the each process in a process space of the each process;

(c) operating the two processes to generate mutually different key pairs to be used in a key exchange and carry out the key exchange between the two processes;

(d) operating the each process to generate a common key according to the key exchange;

(e) generating a shared encrypted data region to be shared by the two processes which is valid only with respect to the common key; and

(f) storing the common key and data used in a course of the key exchange in the hidden data region of the each process.

4. The method of claim 3, wherein the step (e) operates one process among the two processes to generate the shared encrypted data region in a process space of the one process and operates another process among the two processes to map the shared encrypted data region generated by the one process to a process space of the another process.

5. The method of claim 4, further comprising:
setting address information of the shared encrypted data region for the each process in relation to the common key in an encrypted attribute register inside the tamper resistant processor.

6. The method of claim 3, wherein the step (c) operates the two processes to carry out the exchange that includes a verification of a message signature, and the step (d) operates the each process to generate the common key which is authenticated according to the verification.

7. The method of claim 3, further comprising:

encrypting/decrypting data to be sent/received to/from
an external memory at the tamper resistant processor by
referring to information set in the encrypted attribute
register inside the tamper resistant processor when the
each process carries out a write/read operation with
respect to the shared encrypted data region.

8. A method for sharing encrypted data region among three
or more processes on a tamper resistant processor having a
program and data encryption/decryption function, the method
comprising:

(a) shifting an execution mode of the tamper resistant
processor to an encrypted instruction execution mode;
(b) operating an owner process among the three or more
processes to generate a shared encrypted data region to be
shared among the three or more processes;

(c) operating the owner process to specify a common key
for the shared encrypted data region;

(d) operating the three or more processes to generate an
encrypted key notification region for each client process
other than the owner process among the three or more
processes, the encrypted key notification region being
shared only between the owner process and the each client
process;

(e) operating the owner process to notify the common key
to the each client process through the encrypted key
notification region for the each client process;

(f) operating the each client process to map the shared
encrypted data region generated by the owner process to a
process space of the each client process; and

(g) setting address information of the shared encrypted
data region for each process among the three or more
processes in relation to the common key in an encrypted

attribute register inside the tamper resistant processor.

9. The method of claim 8, wherein the step (d) includes:

(d1) operating the each process to generate a hidden data
5 region of the each process in a process space of the each
process;

(d2) operating the owner process and the each client
process to generate mutually different key pairs to be used
in a key exchange and carry out the key exchange between
10 the owner process and the each client process;

(d3) operating the owner process and the each client
process to generate another common key to be used between
the owner process and the each client process according to
the key exchange;

15 (d4) generating the encrypted key notification region to
be shared by the owner process and the each client process
which is valid only with respect to the another common key;
and

(d5) storing the another common key and data used in a
20 course of the key exchange in the hidden data region of the
each process.

10. A tamper resistant processor having a program and data
encryption/decryption function and a memory that stores
25 computer readable program codes for sharing encrypted data
region among two or more processes, the computer readable
program codes include:

a first computer readable program code for causing
said computer to give a common key to each one of the two
30 or more processes in advance;

a second computer readable program code for causing
said computer to shift an execution mode of the tamper
resistant processor to an encrypted instruction execution
mode;

35 a third computer readable program code for causing

10083794-12801
said computer to operate an owner process among the two or more processes to generate a shared encrypted data region valid only with respect to the common key in a process space of the owner process;

5 a fourth computer readable program code for causing said computer to operate each client process other than the owner process among the two or more processes to map the shared encrypted data region generated by the owner process to a process space of the each client process; and

10 a fifth computer readable program code for causing said computer to set address information of the shared encrypted data region for each process among the two or more processes in relation to the common key in an encrypted attribute register inside the tamper resistant
15 processor.

11. The tamper resistant processor of claim 10, wherein the computer readable program codes further include:

20 a sixth computer readable program code for causing said computer to encrypt/decrypt data to be sent/received to/from an external memory at the tamper resistant processor by referring to information set in the encrypted attribute register inside the tamper resistant processor when the each process carries out a write/read operation
25 with respect to the shared encrypted data region.

12. A tamper resistant processor having a program and data encryption/decryption function and a memory that stores computer readable program codes for sharing encrypted data
30 region among two processes, the computer readable program codes include:

35 a first computer readable program code for causing said computer to shift an execution mode of the tamper resistant processor to an encrypted instruction execution mode;

10026794-122801

a second computer readable program code for causing said computer to operate each process among the two processes to generate a hidden data region of the each process in a process space of the each process;

5 a third computer readable program code for causing said computer to operate the two processes to generate mutually different key pairs to be used in a key exchange and carry out the key exchange between the two processes;

10 a fourth computer readable program code for causing said computer to operate the each process to generate a common key according to the key exchange;

15 a fifth computer readable program code for causing said computer to generate a shared encrypted data region to be shared by the two processes which is valid only with respect to the common key; and

20 a sixth computer readable program code for causing said computer to store the common key and data used in a course of the key exchange in the hidden data region of the each process.

13. The tamper resistant processor of claim 12, wherein the fifth computer readable program code operates one process among the two processes to generate the shared encrypted data region in a process space of the one process and operates another process among the two processes to map the shared encrypted data region generated by the one process to a process space of the another process.

14. The tamper resistant processor of claim 13, wherein the computer readable program codes further include:

30 a seventh computer readable program code for causing said computer to set address information of the shared encrypted data region for the each process in relation to the common key in an encrypted attribute register inside the tamper resistant processor.

35

15. The tamper resistant processor of claim 12, wherein the third computer readable program code operates the two processes to carry out the exchange that includes a
5 verification of a message signature, and the fourth computer readable program code operates the each process to generate the common key which is authenticated according to the verification.

10 16. The tamper resistant processor of claim 12, wherein the computer readable program codes further include:
a seventh computer readable program code for causing said computer to encrypt/decrypt data to be sent/received to/from an external memory at the tamper resistant
15 processor by referring to information set in the encrypted attribute register inside the tamper resistant processor when the each process carries out a write/read operation with respect to the shared encrypted data region.

20 17. A tamper resistant processor a having program and data encryption/decryption function and a memory that stores computer readable program codes for sharing encrypted data region among three or more processes, the computer readable program codes include:

25 a first computer readable program code for causing said computer to shift an execution mode of the tamper resistant processor to an encrypted instruction execution mode;

a second computer readable program code for causing
30 said computer to operate an owner process among the three or more processes to generate a shared encrypted data region to be shared among the three or more processes;

a third computer readable program code for causing
said computer to operate the owner process to specify a
35 common key for the shared encrypted data region;

10028794-122801

a fourth computer readable program code for causing said computer to operate the three or more processes to generate an encrypted key notification region for each client process other than the owner process among the three or more processes, the encrypted key notification region being shared only between the owner process and the each client process;

a fifth computer readable program code for causing said computer to operate the owner process to notify the common key to the each client process through the encrypted key notification region for the each client process;

a sixth computer readable program code for causing said computer to operate the each client process to map the shared encrypted data region generated by the owner process to a process space of the each client process; and

a seventh computer readable program code for causing said computer to set address information of the shared encrypted data region for each process among the three or more processes in relation to the common key in an encrypted attribute register inside the tamper resistant processor.

18. The tamper resistant processor of claim 17, wherein the fourth computer readable program code includes:

a computer readable program code for causing said computer to operate the each process to generate a hidden data region of the each process in a process space of the each process;

a computer readable program code for causing said computer to operate the owner process and the each client process to generate mutually different key pairs to be used in a key exchange and carry out the key exchange between the owner process and the each client process;

a computer readable program code for causing said computer to operate the owner process and the each client

process to generate another common key to be used between the owner process and the each client process according to the key exchange;

5 a computer readable program code for causing said computer to generate the encrypted key notification region to be shared by the owner process and the each client process which is valid only with respect to the another common key; and

10 a computer readable program code for causing said computer to store the another common key and data used in a course of the key exchange in the hidden data region of the each process.
